

**IN THE CLAIMS:**

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please cancel without prejudice or disclaimer claims 1-15 the underlying PCT application and ADD new claims 16-30 in accordance with the following:

Claims 1-15 (cancelled)

16. (new) A method for establishing a transcoder-free operation connection between two communication terminals in a communication network, comprising:

checking in a radio network controller, upon receipt of a request from a switching unit relating to use of at least one subset of at least one codec mode configuration for establishment of a transcoder-free operation connection, whether the at least one requested subset is supported by the radio network controller;

establishing a transcoder-free operation connection to the switching unit and a communication terminal, if the at least one subset of the at least one codec mode configuration is supported by the radio network controller; and

signaling, from the radio network controller to the communication terminal, at least one message relating to the subset of the at least one codec mode configuration to be used for transmission of data.

17. (new) A method according to claim 16, wherein at least a part of at least one message relating to the at least one codec mode configuration to be used with at least two codec modes is signaled from the radio network controller to the communication terminal for the transmission of data in an uplink direction.

18. (new) A method according to claim 17, further comprising signaling from the radio network controller to the communication terminal at least a further part of at least one message relating to the at least one subset of the at least one codec mode configuration to be used for the transmission of data in the uplink direction.

19. (new) A method according to claim 18, wherein the radio network controller supports all subsets of a supported codec mode configuration.

20. (new) A method according to claim 19, wherein the transcoder-free operation connection is established from the radio network controller to the communication terminal using a codec mode configuration supported by the radio network controller.

21. (new) A method according to claim 20, wherein the codec mode configuration represents a combination of at least two codec modes.

22. (new) A method according to claim 21, wherein the communication network is a cellular mobile radio network.

23. (new) A method according to claim 22, wherein a radio resource control signaling is used by the radio network controller for signaling to the communication terminal.

24. (new) A method according to claim 23, wherein a mobile radio terminal, mobile computer and/or mobile organizer is used as the communication terminal.

25. (new) A radio network controller for establishing a transcoder-free operation connection between two communication terminals in a communication network having a switching unit and mobile network units, comprising:

send and receive units communicating with the mobile network units; and  
at least one processing unit checking a request sent from the switching unit relating to use of a subset of a codec mode configuration for establishment of a transcoder-free operation connection to determine whether the requested subset is supported by the radio network controller, establishing a transcoder-free operation connection to the switching unit if the subset of the codec mode configuration is supported by said radio network controller, and signaling a message relating to the subset of the codec mode configuration to be used for the transmission of data via said send unit to a communication terminal included among the mobile network units.

26. (new) A radio network controller according to claim 25, wherein said radio network controller signals at least a part of at least one message relating to the codec mode configuration to be used with at least two codec modes for the transmission of data in an uplink direction to the communication terminal.

27. (new) A radio network controller according to claim 26, wherein said radio network controller signals at least a further part of at least one message relating to the at least one subset of the codec mode configuration to be used for the transmission of data in the uplink direction to the communication terminal.

28. (new) A radio network controller according to claim 27, wherein the communication network is a cellular mobile radio network.

29. (new) A radio network controller according to claim 28, wherein the mobile network units include at least one of a mobile radio terminal, a mobile computer and a mobile organizer.

30. (new) A device according to claim 29, wherein the codec mode configuration is a combination of at least two codec modes.
